SUMMARY

Senior Full-Stack Engineer with 8+ years shipping production web applications in TypeScript, React, Next.js, Node.js, and Python. Most recently led the responsive redesign, accessibility, and social voting work for an AI-native shopping agent; before that, founding engineer owning the data pipeline, search, and auth behind an early-stage go-to-market product. Builds daily with Claude Code and other agentic tools.

EXPERIENCE

Wizard AI January 2026 – September 2026
Staff Software Engineer *Remote*

- Shipped shareable product polls so shoppers could put recommendations to a vote among friends, designed end to end: a MySQL schema that enforces vote integrity at the database level, a Type-GraphQL API with scoped authorization and scheduled poll lifecycle jobs, and React flows with guest-viewable share links; Wizard promoted the launch with LinkedIn posts and targeted ads.
- Built the API and sources drawer that show shoppers the reviews and editorials behind each AI recommendation, saving references when chat items are created and upgrading legacy items as they were read instead of migrating large MongoDB collections.
- Led the mobile-to-desktop responsive redesign of the customer app with design, introducing a breakpoint system, MobX-backed navigation, and a reusable drawer pattern that replaced legacy modals.
- Fixed WCAG issues blocking screen reader and keyboard users across checkout, chat, product, gallery, and reviews (blocked zoom, off-screen content read aloud, keyboard focus) after initiating Lighthouse and screen reader audits during the redesign; added accessibility linting to the shared ESLint config and shipped static asset compression.
- Delivered partner signup and dashboard for a new partner program: React flows on a multi-tenant organization model and a GraphQL signup backend creating the organization, membership, and retailer claim in one transaction.
- Wrote the repository's AI assistant instructions (service map, data-layer and auth conventions) used for automated Copilot PR review, and took part in the team's move to an enterprise Claude Code rollout.

Commsor April 2025 – December 2025
Senior Full-Stack Engineer *Remote*

- Founding engineer who owned the product platform end to end: auth, multi-tenant workspaces with RBAC, the core introduction workflow, data pipelines and search, and CRM integrations; designed the technical hiring process (take-home project with live review) and hired and onboarded two engineers.
- Scaled network discovery from ∼100 to tens of thousands of connections per person, with results in under a minute, enabling live sales demos: benchmarked graph databases (Neo4j, TigerGraph) against search, then built an Elasticsearch pipeline over 700M+ profiles with chunked, retryable Inngest jobs and per-workspace concurrency limits.
- Added realtime WebSocket notifications (Supabase Realtime) for background-job and CRM-sync results: private per-workspace channels secured with row-level security, server-only publishing, and batched failure alerts.
- Led the migration from NextAuth to Better Auth after library workarounds caused silent sign-in failures, mapping it onto the existing schema and consolidating user tables; added workspace role-based permissions, Zod-validated Server Actions, and PostgreSQL row-level security for tenant isolation.
- Shipped the end-to-end introduction flow in Next.js and TypeScript, including connection selection, rich-text email templates, status tracking, and delivery through connected Google accounts.
- Built the HubSpot integration: CRM list sync, account-owner mapping, and introduction paths in HubSpot.

Nearform June 2022 – April 2025
Senior Software Engineer *Remote*

- Built the frontend integration for a Module Federation migration at a Fortune 500 e-commerce client, decoupling storefront apps from shared navigation releases; after an all-at-once migration strained downstream teams, pushed for team-by-team rollouts with upfront planning and rollback plans.
- Owned frontend development for an internal application-health monitoring tool at a major telecommunications client, building a data-heavy React/TypeScript interface with React Query.
- Rebuilt Nearform's marketing site and Storybook component library on Next.js, Tailwind CSS, and Sanity CMS, creating reusable page-builder blocks and structured content schemas.
- Contributed features, bug fixes, and documentation to the open-source Victory and victory-native-xl data visualization libraries.

WizeHive September 2020 – June 2022
Software Engineer *Conshohocken, PA*

- Implemented core features for a GraphQL/Apollo rewrite of a legacy grant-management platform, replacing its configurable workflow system.
- Created a visual workflow editor with React Flow that let administrators drag, drop, and configure stages in grant-management workflows.

Vistar Media September 2018 – September 2020
Software Engineer *Philadelphia, PA*

- Developed React/TypeScript features for a digital-out-of-home ad buying platform in a large Bazel codebase with an internal design system.
- Built Python/Flask REST microservices and served on the AWS on-call rotation (Datadog, CloudWatch).

Computer Enterprises Inc. January 2018 – September 2018
Associate Developer *Plymouth Meeting, PA*

- Productionized a national self-storage client's parallel R data science workloads on Azure Batch, with repeatable deployment and monitoring.
- Prototyped an insurance-policy app with Web Components.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, SQL, HTML, CSS/Sass

Frontend: React, Next.js, Vite, Tailwind CSS, shadcn/ui, React Query, SWR, Zod, react-hook-form, MobX, Storybook, Module Federation, React Flow, Victory, Sanity CMS

Backend & Data: Node.js, GraphQL (Apollo, Type-GraphQL), REST APIs, Flask, PostgreSQL, MySQL, MongoDB, Supabase, Supabase Realtime (WebSockets), Elasticsearch, Inngest, Better Auth

Accessibility & Performance: WCAG, screen reader testing, axe, eslint-plugin-jsx-a11y, Lighthouse

Testing & DevOps: Vitest, Jest, React Testing Library, Playwright, Cypress, AWS, GCP, Vercel, Docker, GitHub Actions, Datadog

AI-assisted development: Claude Code, spec-driven development, agent instruction files

EDUCATION

University of Pittsburgh – B.S. Computer Engineering, *Summa Cum Laude*
